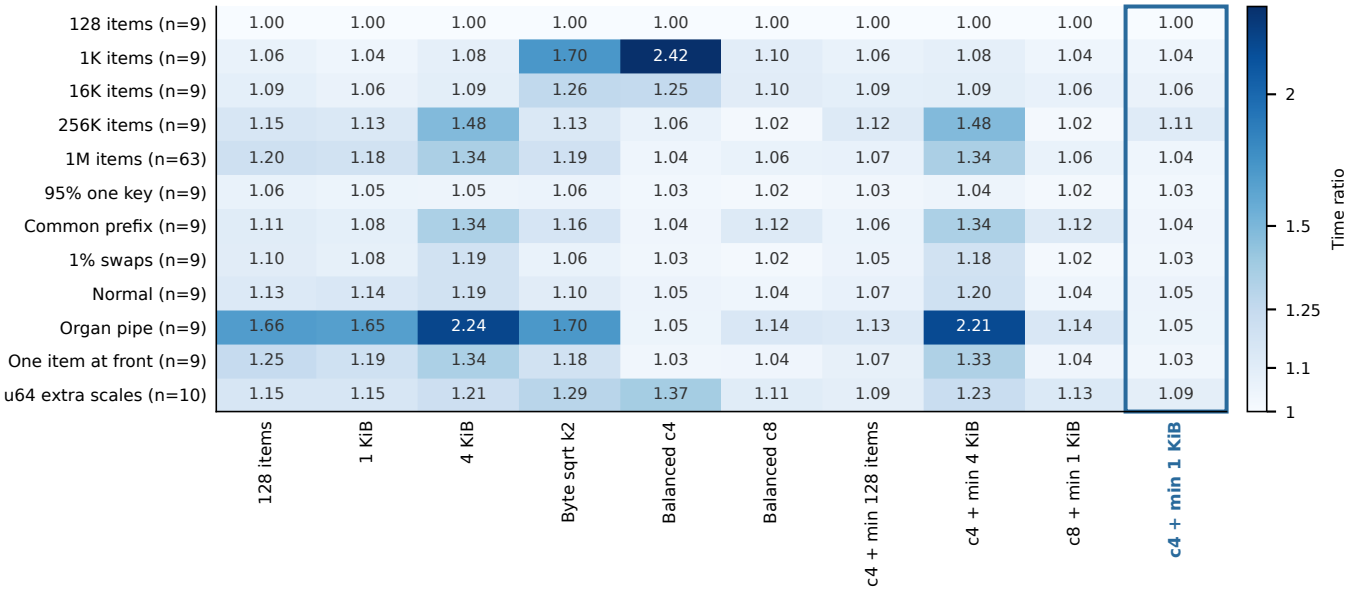
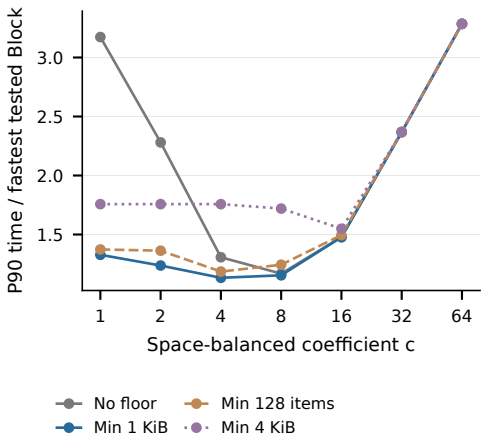
Selecting one block policy across workloads

Completed 109-condition screen: exact measured calls; 10 representative policies shown from 111 formulas.

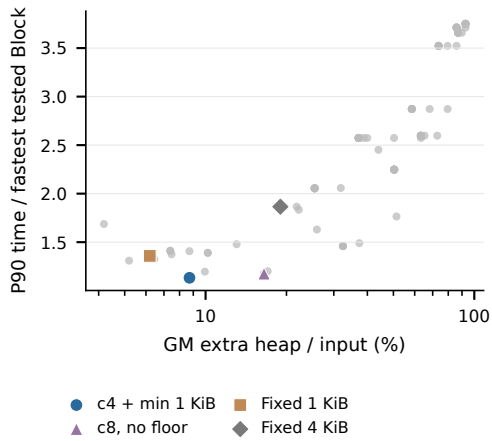
a Per workload: time / fastest tested Block, then GM within each row



b Best measured c is inside the scan



c Time / heap tradeoff: 1M screen



a: 109 measured conditions; parenthetical n counts workloads. Rows overlap. All 111 formulas remain in CSV.

b: 109 screening conditions. c: all 111 formulas, same 63 large conditions; smaller and lower is better.

P90 and GM are descriptive across conditions; no population confidence interval or unique universal optimum is claimed.
