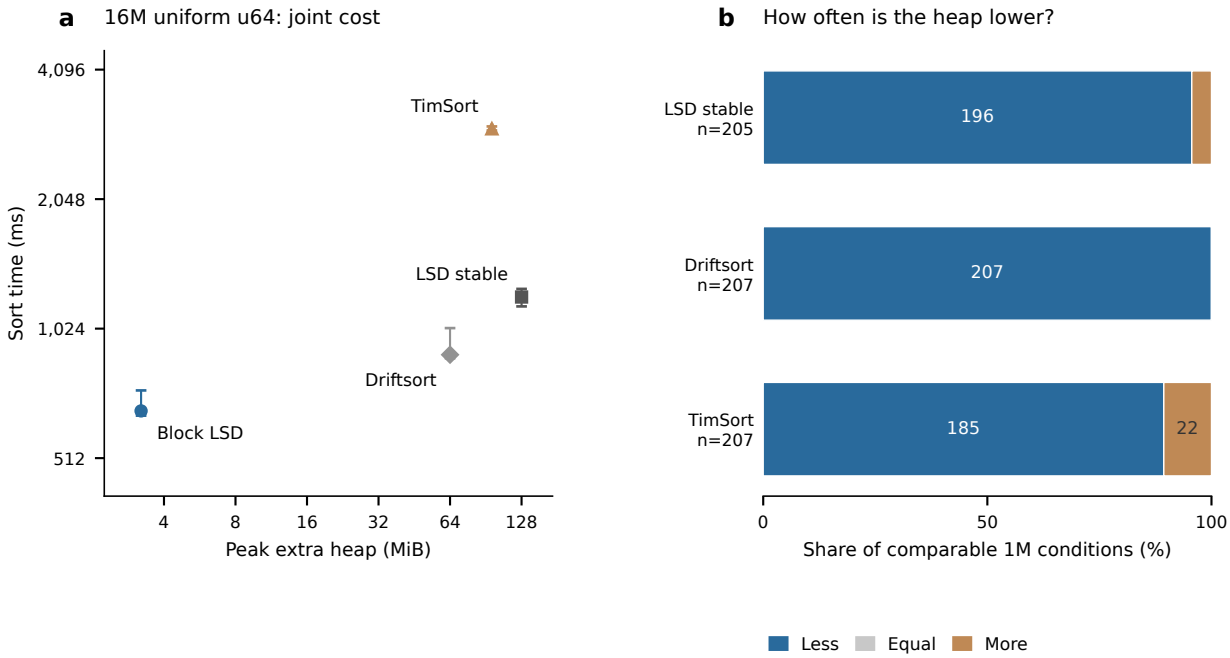
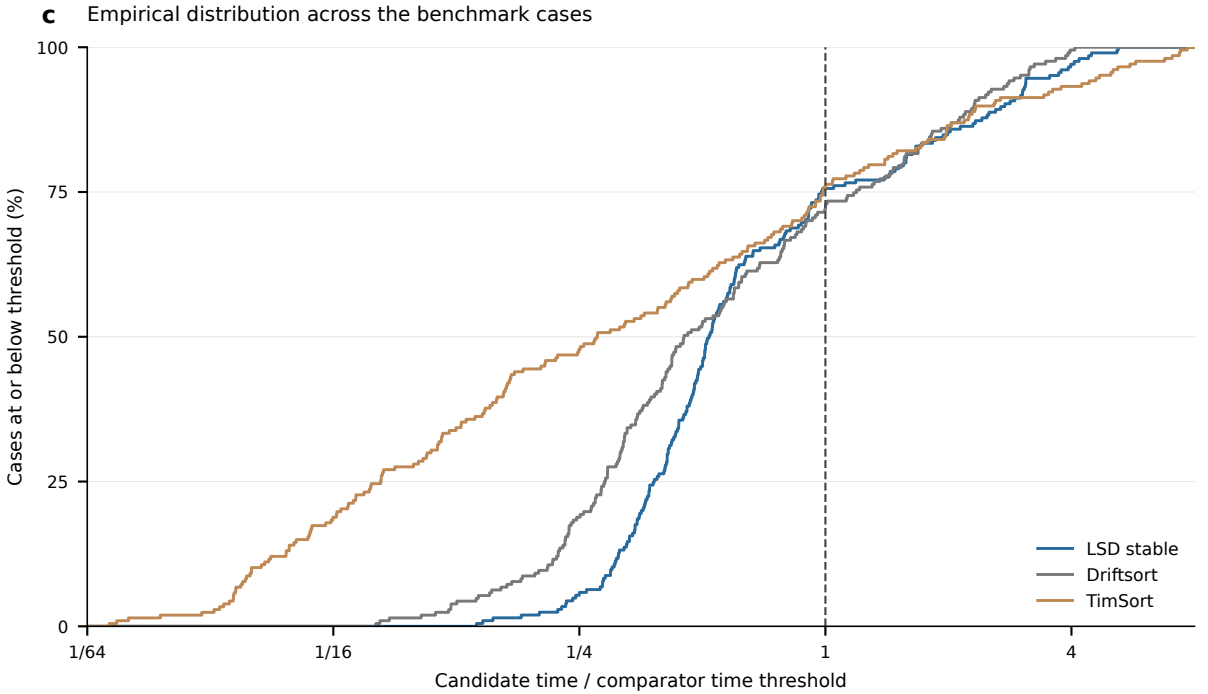
Block LSD: auxiliary heap and overall speed distribution

Block LSD: c = 4, minimum 1 KiB per block; radix = 8





c: every case has equal weight; these curves describe case differences, not timing uncertainty.

1M: LSD has 205 valid cases; Driftsort and TimSort have 207. Two reversed-record LSD oracle failures are excluded.

a: medians and full timing ranges. Details are shown in the per-type comparisons.
